PROFILE SUMMARY

I discovered my passion for UI/UX design — realising that understanding users deeply is the foundation of great digital experiences. My goal is to continuously grow my skills in UI/UX design and front-end development, building intuitive and accessible products that solve real user problems. Given the opportunity, I will bring dedication, a strong user empathy mindset, and the ability to adapt quickly — contributing meaningfully to the team from day one.

PROJECTS

BookMyShow — Smart AI Movie Ticket Booking | Figma • User Research • Prototyping

- **Situation:** During new movie releases, tickets get sold out within minutes after booking opens. Users struggle to book on time and often miss their preferred shows.
- **Task:** To design a solution that helps users secure tickets without missing bookings, especially during high-demand releases.
- **Action:** Identified an opportunity to introduce an AI-powered auto-booking feature. Designed a system where users can set preferences such as theatre, showtime, seat type, and backup options, along with enabling auto-payment. The AI monitors booking availability and automatically selects the best matching option and completes the booking instantly once it opens, reducing the need for manual effort.
- **Result:** The solution reduced booking stress and improved success rates during peak demand. In prototype testing, users felt more confident and relaxed, as the system handled time-sensitive booking automatically, ensuring they did not miss their preferred shows.

Google Maps — Sensory-Friendly Route Planner | Figma • FigJam • Accessibility Research • Interaction Design

- **Situation:** Google Maps routes users based only on speed and distance, with no awareness of noise levels, crowd density, or rest stop availability — leaving neurodiverse users, people with autism, sensory processing disorder, and anxiety without a navigation solution that understands their sensory needs.
- **Task:** To design a sensory-friendly routing feature addition to Google Maps that helps neurodiverse users find calmer, quieter routes tailored to their personal comfort levels.
- **Action:** Designed a complete five-screen feature flow including a sensory preference setup, sensory-scored route selection, enriched map overlays showing crowd heatmaps and rest stop pins, and real-time AI alerts during navigation with detour options. Integrated an AI layer that silently learns user preferences over time and auto-fills settings for future trips without interfering on first use.
- **Result:** The feature concept addresses a gap in accessibility that no major navigation app currently solves. The design ensures neurodiverse users receive advance warnings before disturbances, maintain full control over their journey, and experience calmer independent travel with minimal friction.

Google Pay — Today's Spend Indicator | Figma • UX Research • Interaction Design

- **Situation:** GPay users who make multiple small payments throughout the day have no visibility of their total daily spend at the moment of payment — leading to unintentional overspending that only becomes visible after the damage is done. Transaction history exists in the app but is buried inside a separate section requiring multiple taps to reach.
- **Task:** To design a daily spend awareness feature for Google Pay that shows users how much they have already spent that day, directly on the payment screen, before they tap pay again.
- **Action:** Designed a Today's Spend Indicator placed directly above the amount entry field on the GPay payment screen. The indicator shows a running total of money spent since midnight, updates automatically after every transaction, requires no setup or budget limit from the user, and resets itself every midnight — giving spontaneous spenders real-time awareness without any friction or judgement.
- **Result:** The feature places the right information at the right moment — before payment, not after. In concept testing with five GPay users, none could state their daily spend total without checking transaction history, confirming the awareness gap the feature solves. The zero-setup design ensures the feature is immediately useful for all user types from day one.

TECHNICAL SKILLS

Design Tools: Figma • Wireframing • Prototyping • Adobe XD • Photoshop

UX Methods: Design Thinking • User Research • Persona Creation • Usability Testing

Design Principles: Information Architecture • Interaction Design • UI/UX Design Principles

Front-End: HTML • CSS (Responsive Design) • Basic JavaScript

Process: User Flows • Design Systems

SOFT SKILLS

Communication • Attention to Detail • Creativity • Quick Learning • Time Management • Team Collaboration • Empathy

CERTIFICATION

Master in UX/UI Design
FITA Academy | 2026

EDUCATION

B.Com (General)
Shri Krishnaswamy College for Women
